INTERNATIONAL PRELIMINARY **EXAMINATION REPORT - SEPARATE SHEET**

Re Item V

Reasoned statement with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

Reference is made to the following documents:

- D1: SPRING FRANCES A ET AL: "Intercellular adhesion molecule-4 binds alpha4beta1 and alphaV-family integrins through novel integrin-binding mechanisms" BLOOD, vol. 98, no. 2, 15 July 2001 (2001-07-15), pages 458-466, XP002273536 ISSN: 0006-4971
- D2: BAILLY P ET AL: "THE LW BLOOD GROUP GLYCOPROTEIN IS HOMOLOGOUS TO INTERCELLULAR ADHESION MOLECULES" PROCEEDINGS OF THE NATIONAL ACADEMY OF SCIENCES OF USA, NATIONAL ACADEMY OF SCIENCE. WASHINGTON, US, vol. 91, no. 12, 7 June 1994 (1994-06-07), pages 5306-5310, XP002013399 ISSN: 0027-8424
- D4: HERMAND PATRICIA ET AL: "Binding sites of leukocyte beta2 integrins (LFA-1, Mac-1) on the human ICAM-4/LW blood group protein JOURNAL OF BIOLOGICAL CHEMISTRY, vol. 275, no. 34, 25 August 2000 (2000-08-25), pages 26002-26010, XP002273537 ISSN: 0021-9258

The application teaches a site-directed mutagenesis study on residues from ICAM-4 which, according to the predicted three-dimensional structure, are surface-exposed. The application also provides the identification of those residues which are involved in binding to $\alpha_4\beta1$ and αV -family integrins (F18, W19, V20 on A strand; K118 on the B-strand; W77 and L80 on the F-strand; R92, A94, T95, S96 and R97 on the G-strand and W66, N160, V161 and T162 on E strand). Several epitopes and footprints comprising some of the above residues are proposed which might be required for integrin binding. Based on the sequence of said epitopes, four antagonistic peptides have been identified (SEQ ID NO:9-11 and 13) which inhibit erythroblast and neutrophil adhesion to ICAM-4.

D1 discloses the predicted 3D-structure of ICAM-4 derived by molecular modelling from the known crystallographic structure on the crystal structure of ICAM-2 (see figure 2 and page 460, left-hand column last paragraph - left column, third paragraph). The predicted

INTERNATIONAL PRELIMINARY INTERNATION REPORT - SEPARATE SHEET

International application No.

PCT/GB 03/04744

3D structure of ICAM-4 implicitly contains all the different epitopes and footprint domains which have been identified in the present application as being involved in binding to $\alpha 4\beta 1$ and αV -family integrins and which are the object of claims 1-10. Therefore, the contents of D1 anticipate the subject-matter of **claims 1-10**.

D2 provides a model of the 3D structure of ICAM-4 based on the crystal structure of ICAM-2 and identifies the different strands and domains as in the present application (see figure 1). Therefore, this document also takes away the novelty of **claims 1-10**, since the different epitopes and footprint domains embraced by the claims are also implicitly present in the predicted 3D structure disclosed in this document.

It could be alleged that the tridimensional structure of the ICAM-4 as described in D1 and D2 merely consists of an array of overlapping potential antigenic determinants which lacks any information about which regions are important for binding to the $\alpha_4\beta1$ and αV -family integrins. However, the fact is that the three-dimensional structure of ICAM-4 was already known in the prior art, and that said structure contains, even if not yet characterised, all the epitopes which are responsible for binding to the different ICAM-4-substrates. The fact that the applicant have identified for the first time the amino acids that form said epitope does not change the fact that the epitope had already been made available as a region within a larger structure. Thus, the contents of D1 and D2 contain an implicit disclosure of the epitopes of claims 1-10.

The antagonistic peptides defined by SEQ ID NO:9-11 and 13 have not been disclosed in the prior art. In addition, D2, which can be considered as the closest prior art, provides anti-ICAM-4 antibodies which act as ICAM-4 antagonists in a binding assay of Fc-ICAM-4 to the β 2 integrins LFA-1 and Mac-1 (see figure 5). The document differs from the subject-matter of claims 11-22 in that the ICAM-4 antagonists are the peptides of SEQ ID NO:9-11 and 13, with the corresponding technical effect that the antagonists are able to prevent adhesion of ICAM-4 to integrins of the $\alpha_4\beta$ 1 and the α V families. Thus, the problem to be solved by the present application is the provision of alternative ICAM-4 antagonist able to block the interaction of ICAM-4 with integrins of the alpha4beta1 and alphaV families. The skilled person, when posed with the above problem, would not be able to arrive to the peptides identified in the present invention, since D2 does not even suggest that the adhesive activity of ICAM-4 could be antagonised with peptides derived from the binding sites instead of with anti-ICAM-4 antibodies. Even if D1 shows that the binding of ICAM-4 sites instead of with anti-ICAM-4 antibodies.

INTERNATIONAL PRELIMINARY International application No. EXAMINATION REPORT - SEPARATE SHEET

PCT/GB 03/04744

to cells is mediated through interactions with $\alpha_4\beta1$ and αV integrins (see figure 5), there is no indication in this document that said interaction could be prevented with peptides derived from the structure of ICAM-4. Therefore, the skilled person would not be able to arrive at the antagonistic peptides defined in the claims when considering the teaching of D1 and D2. Thu,s the subject-matter of claims which relate to the antagonistic peptides of SEQ ID NO:9-11 and 13 (claims 11-14), as well as all other claims relating to the uses of said peptides for antagonising the ICAM-4 epitopes or for medical purposes (claims 15-22) involve an inventive step.

D3 teaches the sequence of the cDNA coding for ICAM-4 (see figure 2). This cDNA encodes the epitopes and footprint domains of claims 1-10 and therefore, it anticipates the subject-matter of **claims 23 and 24**, as far as it relates to nucleic acid coding for the epitopes or footprints of claims 1-10. It could be alleged that the cDNA provided in D3 encodes for the full-length ICAM-4, whereas the present claims relate to nucleic acids coding for the epitopes. However, due to the fact that the epitopes and footprint domains are formed by amino acids which are non-contiguous in the polypeptide chain, the nucleic acids encoding said epitopes must necessarily comprise sequences coding for the intervening regions between the amino acids which form the epitopes. In addition, claim 24 relates to the nucleic acid of SEQ ID NO:12, which corresponds to the sequence of the polynucleotide coding for the mature form of human ICAM-4, which is also disclosed in D3 (see the underlined part of the sequence in figure 2).

Other remarks

Claim 21 is not clear. It is not apparent how a disease which is related to a decreased binding of ICAM-4 could be treated with a compound which antagonises binding of ICAM-4 to its receptor, since it could be expected that such a compound would lead to an even stronger decrease in the levels of ICAM-4 binding.
